Efficiency: More value to your facility
Siemens steam turbine portfolio
Steam turbines from 10 kW to 1,900 MW
With over a century of experience and continuous development in steam turbine technology, Siemens has stayed at the forefront of development and is a prime partner for your business. With a fleet of more than 60,000 steam turbines worldwide, Siemens is a reliable and experienced partner.

Siemens Steam Turbines are an essential piece of turbo-machinery to many power plants worldwide. They are applied either as a generator drive or a mechanical drive for pumps and compressors. The modular design concept of all steam turbines ensures high flexibility, availability and a reduction of time-to-market.

Dresser-Rand Steam Turbines
Utility steam turbines from 90 to 1,900 MW

Siemens offers a comprehensive range of steam turbine products in the power output range from 90 to 1,900 MW. These are used in conventional fossil-fired steam power plants as well as in nuclear and combined cycle power plants. With more than 8,000 steam turbines in service worldwide we provide proven technology, adapted to the specific local conditions.

The Ribatejo power plant was one of the most technologically advanced combined cycle power plants at the time of construction. In operation: unit1: 02/2004, unit2: 10/2004; unit3: 03/2006

Net plant output: 3 × 390 MW
Steam turbine output: 3 × 142 MW

Flexibility and operational flexibility, high availability and long lifetime
Low complexity and low total plant costs
Short project schedule and installation time

Flexible steam turbine for applications in single-shaft and multi-shaft combined cycle configurations
In our Siemens Steam Turbine portfolio, we offer with the SST-3000 series steam turbine a compact arrangement, that features a two-cylinder design with an axial exhaust for use in combined cycle power plants.

Steam turbines of SST-3000 series are exceptionally compact machines for use in combined cycle power plants.

The SST-3000 series covers the power output range from 90 to 250 MW.
It features a separate high-pressure (HP) turbine and combined intermediate-pressure/low-pressure (IP/LP) turbine with single flow axial exhaust for 50 and 60 Hz applications.

The SST-4000 series is our specialized turbine for non-reheat, combined cycle applications. With the specialized design of the blade path, the entire power range from 100 to 380 MW can be covered with the highest reliability and availability. Almost 40 turbines of this type are already in operation or in the commissioning stage, with a total installed capacity of approximately 7,200 MW.

The SST-4000 series consists of an intermediate-pressure and a low-pressure turbine. The installation is either high or low level arrangement with down, double-side or single-side exhaust. The turbine is able to provide process steam e.g. for industries or sea water desalination and can provide industrial heating.

Thanks to its systematically modular design, the SST-4000 series can easily be adapted to the individual operating conditions and thermal cycle design of the plant. Its fast installation, thanks to prefabricated, tested modules delivered ready for connection, is of additional advantage.

Al Ezzel, Bahrain

The power plant makes an important contribution towards meeting the country’s growing power demand in an economic and environmentally compatible manner.

Lausward “Fortuna”, Germany

The combined cycle power plant set three world records: in the acceptance test a maximum electrical net output of 603.8 MW was achieved and the net energy conversion efficiency was around 61.5 percent.
- in the acceptance test a maximum electrical net output of 603.8 MW was achieved and the net energy conversion efficiency was around 61.5 percent.
- overall plant efficiency considering thermal extraction was above 85%.
- 300 MW thermal power extraction through one steam turbine train.

Plant type: SCC5-8000H 1S (single shaft)
Power output: 604 MW
Efficiency: 61.5 %

The SST-5000 is suitable for supercritical and ultra-supercritical steam power plants. Due to its higher pressure and temperature ratings, power plant efficiency increases to more than 46 percent and overall performance is improved.

In steam power plants the SST-5000 consists of a combined high pressure/intermediate pressure turbine, and one or two low pressure turbines with down exhaust, single sided or double sided exhaust. It is installed in a low- or high-level arrangement. Various extractions (up to 9 stages) contribute to an optimized plant efficiency.

Combined stop & control valve

Valve connection below the horizontal flange of the HP-IP turbine for easy maintenance.

High-pressure/intermediate-pressure turbine

Combined HI turbine with circular inner and outer casing for minimal thermal deflection and minimal clearances for high efficiency.
Single crossover pipe

Crossover pipe designed to minimize losses, reduces plant complexity and minimizes footprint.

Low-pressure turbine

Inner and outer casing of the double-flow turbine are mechanically decoupled. That allows minimal radial clearances resulting in maximum efficiency. The condenser is installed either below, on one side or on both sides of the low-pressure turbine.

Bearing

Single bearing arrangement between HP-IP and LP turbine cylinders for simple alignment and stable operation.
Reduced lifecycle costs with the SST-6000 steam turbine

Siemens Steam Turbines of the SST-6000 series are widely operated in steam power plants with a power output up to 1,200 MW and an efficiency up to more than 46 percent. Turbine trains of the SST-6000 series consist of a high-pressure turbine, an intermediate-pressure turbine, and up to three low-pressure turbines for 50 and 60 Hz.

The SST-6000 is installed in a high-level arrangement with down exhaust. Various extractions (up to 10 stages) are available for feed water preheating, process steam, and district heating.

The globally installed capacity of the SST-6000 all over the world is more than 100,000 MW.

Eemshaven, Netherlands

Thanks to a highly efficient power plant process the Eemshaven steam power plant consumes less hard coal compared to the average of coal-fired power plants. This leads to a reduction in CO₂ emissions of 2.5 million metric tons per year.

Power output: 2 × 800 MW
Efficiency: 46.2%
Main Steam: 275 bar / 597°C
3,989 psi / 1,107°F
Reheat Steam: 609°C / 1,128°F
Commissioning: 2014

</tbody>
</table>
Intermediate-pressure turbine

Double-flow intermediate-pressure turbine
- Circular inner and outer casing for minimum thermal deformation and minimum clearances for high efficiency
- Shipped to site fully assembled for smooth erection and start

High-pressure turbine

Barrel type HP turbine, no half joint flange connection
Single-flow high-pressure turbine with circular inner and outer casing, optimum thermal loading and small clearances.

Bearing

Fixed bearing
Single, fixed bearing arrangement between HP and IP turbine cylinders for simple alignment and stable operation. Fixed bearing pedestals on foundation crossbeams.
**Crossover pipe**

**Single crossover pipe**
Large diameter pipe to minimize losses and to reduce plant complexity and steam turbine footprint.

**Low-pressure turbines**

**Double-flow low-pressure turbines**
Inner and outer casing are mechanically decoupled preventing displacement and deformation of the inner casing. That allows minimal radial clearances resulting in maximum efficiency.

The outer casing is directly welded on the condenser underneath the low pressure turbine casing.

**Valve**

**Combined stop & control valve**
- For easy opening of steam turbine casing valves are connected to the lower part of the outer casing via bolt connection.
SST-9000
Utility steam turbine package

Leading technology for efficient, flexible and reliable power generation

The SST5-9000 is a highly reliable steam turbine for applications in the conventional islands of advanced pressurized water reactors in nuclear power plants, with a power output up to 1,900 MW.

The half-speed SST5-9000 features a double-flow saturated steam high-pressure (HP) turbine and up to three double-flow low-pressure (LP) turbines with shrunk-on disk rotors.

Shrunk-on disk design features proven technology: eliminating stress-corrosion cracking and replacement of the low-pressure rotors or disks during the design life-time.

SST-700/900 ......................................................... 44
The SST-150 is a single-casing steam turbine, providing geared drive to a 1,500 or 1,800 rpm generator. The turbine is packaged in a skid-mounted design (can also be with separate oil system). This is a very compact arrangement which provides high efficiency in power generation and mechanical drive applications. The pre-engineered turboset enables early planning of the turbine building layout, saving time for the customer.

The SST-150 is a steam turbine with impulse blading, developed to meet the most demanding customer requirements for cost-efficient power generation and mechanical drive applications. The turbine is used for both backpressure and condensing applications with internally controlled extraction and scope for several bleeds. Both back pressure and condensing turbines are available with upward or downward exhaust. The exhaust flange can be equipped with top or bottom exhaust.

Roi Et, Thailand: Turbo set for the Bua Sommai Electricity biomass power plant.
Typical applications

- Mechanical drive
- Combined-cycle power plants
- Cogeneration/Combined Heat and Power and district heating
- Waste incineration plants and and biomass power plants
- Waste heat recovery
- Captive power plants for Pulp and paper mills, steelworks, mines, and for the sugar, textile, chemical and petro-chemical industries
The Siemens SST-200 Siemens industrial steam turbine product line is based on the reaction blade technology.

The turbine series follows a modular product philosophy, ensuring a high level of performance and reliability.

The ability to combine standardized casing modules enable optimal design flexibility. This allows the turbine series to achieve high performance in combination with an optimal cost position.

Each steam path is customized for optimal fit to the specific thermal cycle requirements providing high efficiency over the entire operating range.

The inlet and exhaust sections are configured to cover different plant configuration needs and are used in condensing configurations as well as in back pressure applications.

With this flexible approach the SST-200 covers the range of both industrial mechanical drive and industrial power generation applications.

The product design closely follows API 612 requirements.
### Typical applications

- Generator and mechanical drive
- Chemical and petrochemical industry, such as Ethylene plants, Ammonia and fertilizer plants, Methanol plants
- Sugar mills
- Biomass plants
- Metalls & mining
- Energy from waste plants

The SST-300 is an optimal solution for a wide range of applications due to the implementation of the best technology combined with over 20 years of experience. In the last decade alone, this turbine has been installed in over 500 industrial and power applications by customers all over the world.

The flexible configuration of the SST-300 enables it to be used in diverse applications such as waste-to-energy, chemical processing, pulp and paper, cement and many more.

All components and auxiliaries including the lube oil system are mounted on a common base frame. The turbine can be configured with either an upward, downward or axial exhaust orientation depending on the layout of the plant. The turbine can also accommodate multiple steam extraction/steam induction points as well. The compact design and simple layout of the turbine significantly reduce the cost and time associated with its construction, inspection and maintenance.

Waste-to-energy plant, Lincoln/UK

In operation since 2014, the Lincolnshire Waste-to-energy facility provides a safe, sustainable and affordable waste treatment solution to dispose of household waste, with a useful and profitable by-product: electricity. It burns 150,000 t of waste a year.

- Sugar industry
- Steel works and mines
Valve arrangement

Internal valve arrangements (or adaptive stages) control the steam flow and maintain constant process steam extraction pressures over a wide flow range.

Base frame

SST-300 turbines are delivered as packaged units with simple or integrated base frame. The oil tank is inside the base frame.

Only a minimal number of external connections, which are clearly defined according to standards, ensure fast and easy installation.
SST-300

Exhaust

Equipped with upward, downward or axial exhaust orientation

Turbine Casing

The nearly symmetrical casing allows short start-up times and quick load changes.

Reaction Blading

The rotor is fitted with resonance-proof fully shrouded blading. The last stage is free standing with a damping wire (condensing steam turbine)
The SST-400 is a single casing steam turbine, providing geared or direct drive to 50 and 60 Hz generators, or to compressors and pumps. The symmetrical casing with horizontal joint flange enables the SST-400 to accept short start-up times and rapid load changes.

The modular package design allows a wide variety of configurations to satisfy the customer’s individual needs in the most economical way. The utilization of selected proven components assures high reliability and easy maintenance.

The SST-400 can be equipped with upward, downward or axial exhaust to fit with the selected installation. The turbine skid can be combined with standardized gearbox-oil units and generators to a turboset, according to the customer’s needs.

The turbine skid and gearbox/oil unit are fully assembled in the workshop before being shipped to the site. Our proven installation and maintenance concept lowers maintenance cost by enabling easy access to the installed components, the turbine, gearbox, and generator.
**SST-400**

**Power output**  
up to 60 MW

**Speed**  
up to 8,000 rpm

**Live steam parameters**

**Inlet pressure**  
up to 140 bar / 2,030 psi

**Inlet temperature**  
up to 540°C / 1,004°F

**Exhaust steam parameters**

**Back pressure**  
up to 25 bar / 363 psi

**Condensing**  
up to 0.3 bar / 4.4 psi

**Steam extraction**

**Controlled (up to 4):**  
up to 45 bar / 510 psi

**Uncontrolled**  
up to 60 bar / 870 psi

**Typical applications**

- Power generation industrial power plants
- Biomass & waste
- District heating
- Combined cycle power plants
- Mechanical drive
- Waste heat recovery
The SST-500 is a single casing, double exhaust flow steam turbine, which can be used as an entire drive or as the low-pressure module of a multiple-casing turboset, directly driven or geared. This turbine, with its capacity to operate over a wide range of speed and power, is ideal for large steam volume flows. Steam flows into the turbine via two tangential inlets to equalize thermal loading and blade stress. Emergency stop valves and control valves are installed in the steam inlet pipes. The steam flows tangentially into the inner casing and then axially to both exhausts. The customized design of the steam path allows exact adjustment to surpass general physical limitations of the last stage blades. Double-end drive is available, if required, e.g. for booster pump drive.

Booster pump drive, Shanghai/China

Customer: Shanghai Municipal Electric Power Co
Project: The coal-fired Wai Gao Qiao power station consists of eight generating units including four 300 MW sub-critical, two 900 MW supercritical and two 1,000 MW ultra supercritical units
Application: Booster pump drive
Power output: 19.4 MW (steam turbine)
Speed: 5,912 rpm
Inlet temperature: 343 °C / 649 °F
Inlet pressure: 11.1 bar / 160.9psi

Customized steam path according to the customer’s needs
Short delivery time due to extensive pre-design
Easy access to mechanical components facilitates maintenance

### Typical applications

- Pump drive (e.g. feedwater pump for large boilers)
- Generator drive
- Compressor drive
- Chemical industry
- Steel works
- Waste to energy, e.g. waste incinerators
- Waste heat from chemical processes
SST-600
Flexible condensing or back-pressure steam turbine

Generator drive in various packages
We deliver a standard steam turbine generator set including the SST-600 (with or without gearbox), a generator, oil system, piping and instrumentation and the control system.

The standard package can be extended to include a condenser, condensing plant or pre-heating system.

The SST-600 with its reliable and flexible design is available with axial or radial exhaust.

Mechanical drive
The SST-600 is also an efficient and economic mechanical drive. Since the 1970s, hundreds of projects have been successfully implemented all over the world using the SST-600 to directly drive everything from the smallest boiler feedwater pump just as reliably as the largest compressor even in the most complex processes. The SST-600 complies with regulations including the API standard.

Biomass district heating plant, Västergötland / Sweden

The district heating plant operated by Mölndal Energie supplies 91MWth thermal power and 23 MWe electricity. It has been in operation since 2009 and uses wood as fuel. Siemens delivered the complete turboset (SST-600 and generator).

Power output: 25 MW
Live steam temperature: 519 °C / 966 °F
Live steam pressure: 122 bar / 1,769.5 psi
Exhaust steam pressure: 0.5 bar / 7.3 psi
Speed: 5,000 rpm
### SST-600

**Power output**  
up to 200 MW

**Speed**  
3,000 to 18,000 rpm

### Live steam parameters

**Inlet pressure**  
up to 165 bar / up to 2,393

**Inlet temperature**  
up to 565°C / 1,050°F

### Exhaust steam parameters

**Back pressure**  
up to 80 bar / 1,160 psi

**Condensing**  
up to 1.0 bar / 15 psi

**District heating**  
up to 3.0 bar / 43 psi

### Controlled extractions (up to 2)

**Pressure, ext. valve**  
up to 72 bar / 1,044 psi

**Pressure, int. valve**  
up to 45 bar / 798 psi

**Temperature**  
up to 480°C / 895°F

### Uncontrolled extractions (up to 6)

up to 85 bar / 1,233 psi

### Typical applications

- Chemical and petrochemical industry
- Pulp and paper mills
- Steel works
- Mines
- Power plants
- Seawater desalination plants
- Biomass and Waste-to-energy plants (waste incineration)
A wide range of exhaust sizes and types is available for back-pressure and condensing applications.

The improved cylindrical high pressure blades and tapered intermediate pressure blades allow longer airfoils and contribute to the overall high efficiency.

The improved sealing system allows more sealing strips per blade row at both moving and stationary blades.
Intermediate section

Can be designed for straight flow, or equipped with uncontrolled and/or controlled extractions.

Casing

The symmetrical design of the upper and lower halves avoids material concentrations and ensures improved thermal behavior and an improved start up time.

Bearing

The possibility of applying up to 3 balancing pistons minimizes thrust and allows smaller axial bearings. Thanks to improved journal bearings less oil and a smaller oil tank are needed.
Steam Turbines for Pulp & Paper Industry

SST-800, Klabin / Brazil

Two Siemens SST-800 steam turbines are supplying electricity and process steam to a pulp factory in Brazil. The SST-800 has a capacity of 190 megawatts (MW), making it among the largest steam turbines in use in the pulp and paper industry worldwide.

- **Power output:** 190 MW
- **Speed:** 3,600 rpm
- **Inlet steam pressure:** 100 bar / 1,450 psi
- **Inlet steam temperature:** 498°C / 928°F

Steam turbine for the pulp plant Klabin, Brazil
Typical applications

- Combined cycle power plants (CCPP)
- Combined heat and power plants (CHP)
- Oil & Gas industries
- Industrial power plants (e.g. captive power plants in chemical and petrochemical industries, manufacturing industries, paper mills, mines, metal and cement plants, waste heat recovery)
- District heating plants
- Biomass plants and waste-to-energy plants (WtE)
- Concentrated solar power plants (CSP)

Center steam admission

The reverse flow adjusts the thrust and relieves the bearings of large steam turbines.

Bearings

Simplified maintenance due to horizontal casing split or independently accessible bearings.

Steam path

Highly customized section with up to 2 internally or externally controlled extractions and up to 7 uncontrolled extractions.
The steam turbine casing is based on a combined housing concept featuring a cast steel and welded design. The material mix ensures high availability and reduced delivery times.

Exhaust section

Axial or downward connection for condensing, upward or downward connection for back pressure is provided.
**SST-700 / 900**

**Industrial steam turbine**

- Fast load changes
- Short start up times
- Increased efficiency
- Increased life cycle
- Low level arrangement
- Reheat application

**Economical dual casing steam turbine for reheat applications**

The SST-700/900 is a standard turbine solution with short delivery time due to its fixed pre-engineered design. Predefined modules enable a short manufacturing period, cost-efficient material supply and a fast ex-works delivery.

The straight flow turbine solution with power output of up to 250 MW consists of a geared high-pressure steam turbine (backpressure), an intermediate/low-pressure steam turbine (condensing), both driving a generator installed in between.

The dual casing reheat turbine configuration with inner casing is a competitive and optimized product for combined cycle power plants and concentrated solar power plants.

---

**Parabolic trough technology in Morocco**

On February 4, 2016, the King of Morocco, Mohammed VI, inaugurated the Noor I unit of Ouarzazate Solar Power Station. This is the first of four phased Noor projects at Ouarzazate site which are expected to provide a total electrical generating capacity of 580 megawatts, making it the largest complex of its kind in the world. Siemens is supplying three turbine-generator sets for the power station.

**Steam turbine: SST-700/900**

- **Power output:** 160 MW
- **Inlet steam temperature:** 380 °C / 716 °F
- **Inlet steam pressure:** 168 bar(a) / 2,437 psi
- **Exhaust pressure:** 0.06 bar(a) / 0.87 psi
Steam turbine SST-900 for the CSP-plant NOOR III, Morocco

**Typical applications**

- Combined cycle power plants
- Concentrated solarthermal power plants
- Biomass-fired power plants
With the D-R steam turbine portfolio Siemens has the most comprehensive range of API turbines available on the market, including:

- Standard single stage turbines for pump, fan & small compressor drives according to API 611 General Purpose (GP) standard
- Standard and engineered single stage turbines as generator drives for waste heat recovery applications
- Engineered single stage turbines for applications according to API 611 (General Purpose — GP) or API 612 (Special Purpose — SP) standards
- Standard multistage turbines for larger pumps, fans & compressors to API 611 or API 612 standards, or for power generation
- Engineered Multi-Stage Turbines according to API 612 for main compressor drives or power generation
- Turbines for geothermal plants
- Turbines for expansion of ORC and process fluids

As required either bare ST drivers to OEMs, or complete packages including gears, lube oil systems and controls are supplied

Benefits:

- Highest levels of quality & reliability for the most critical services in the business
- All units factory tested in accordance with API and customer requirements
- Units with modular designs, but engineered to order, according to customer project specifications & standards and local environmental requirements
D-R SST 350/500/700

Standard single stage steam turbine

Typical applications

- Refineries

Reference examples

Our steam turbines meet customer requirements for economic installation and operation as well as providing excellent flexibility for complex processes.

Worldwide, hundreds of successfully installed generator drives for power generation or a mechanical drives for compressors, blowers and pumps are in operation and reliably provide power.
Reference examples Steam Power Plants

Ultra-supercritical steam power plant
Lünen, Germany

Lünen is the cleanest and most efficient hard-coal-fired power plant in Europe. It provides electricity for around 1.5 million households. It also supplies the city of Lünen with district heating. Using leading-edge Siemens technology makes it possible to save up to a million tons of CO2 every year.

Power output: 812 MW
Efficiency: 46%
Commercial operation: 2013

Ultra-supercritical steam power plant
Waigaoqiao III, China

Since startup in 2008, Waigaoqiao III has compared to an average Chinese coal-fired power plant saved 900,000 million metric tons of raw coal. The plant reaches an efficiency of up to 45% making it a highly efficient coal plant. In 2009, Waigaoqiao III was “Asian Power Plant of the Year” and got an “Asian Power Award”.

Power output: 2 × 1,000 MW
Efficiency: 45%
Commercial operation: 2008
Ultra-supercritical steam power plant
Isogo, Japan

At the time, Siemens was the first company to supply a machine for this temperature range.

- Power output: 600 MW
- Steam conditions: 600 °C / 610 °C
- Commercial operation: 2002

Ultra-supercritical steam power plant
Yuhuan, China

In 2008, Yuhuan was China’s most advanced coal-fired power plant and got the “Asian Power Award”.

- Power output: 4 × 1,000 MW
- Efficiency: 45%
- Commercial operation: 2007
Reference examples  Combined Cycle Power Plants

Combined cycle power plant Dangjin III
South Korea

Siemens turbines are making Dangjin III the most efficient combined cycle power plant currently operating in Asia.

- Power output: 400 MW
- Efficiency: 60%
- Commercial operation: 2013

Combined cycle power plant for the mining industry
Diamantina, Australia

Two Power Islands each performing at well in excess of 51% efficiency. The plant provides a total capacity of 242 MW to supply ecofriendly electricity to local mines and to people living in the region.

- Power generation solution for island off-grid operation matching the variable power demand of the adjacent copper mine.
- Two power islands consisting each of:
  - 2 × SGT-800 gas turbines and 1 × SST-400 steam turbine
  - 2 × heat-recovery steam generators

- Power output: 242 MW
- Commercial operation: 2014
Combined cycle power plant  
Panda Sherman Power Project, Texas, USA

The Panda Sherman Power Project utilizes the latest, most advanced emissions control technology, making it one of the cleanest, natural gas-fueled power plants in the United States. The 758 MW combined cycle generating facility can supply the energy needs of up to 750,000 homes.

- Plant type: SCC6-5000F 2 × 1 Flex-Plant™
- Power Output: 758 MW

Power block for combined cycle power plant  
Nhon Trach 2, Vietnam

The power plant reaches an efficiency of over 57 percent and has very low nitrogen oxide emissions. It entered commercial operation after just 28.5 months.

- Power output: 760 MW
- Efficiency: 57%
- Commercial operation: 2011
Reference examples  Biomass and Waste-to-energy

Igelsta  
Södertalje, Sweden

SST-800: Biomass District Heating Plant

Sweden’s largest biomass plant

Inaugurated in March 2010, the plant uses a biomass fuel mix consisting of about 90% renewable fuels like forest refuse, wood chips, tree bark, and 10% non-recyclable waste paper and plastic.

It produces 200 MW heat and 85 MW electricity, the equivalent of heating 50,000 households and generating electricity for 100,000 residences.

Steam turbine: SST-800  
Power output: 90 MW  
Inlet pressure: 85 bar / 1,305 psi  
Inlet temperature: 540°C / 1,004°F

Afval Energie Bedrijf  
Amsterdam/Netherland

Afval Energie Bedrijf (AEB; Waste and Energy Company Amsterdam) burns 1.7 million tonnes of waste per year and has recently increased its energy generation efficiency from 22% to 30%. This 8% increase resulted from installing a new SST-700 with a steam reheat system.

AEB not only generates power from Amsterdam’s municipal waste, but also recovers and sells materials from the waste stream such as metals and gypsum.

Steam turbine: SST-700, Reheat  
Power output: 74 MW  
Inlet pressure: 125 bar / 1,813 psi  
Inlet temperature: 440°C / 824 °F  
Fuel: Municipal solid waste
Biomass Power Plant Simmering
Vienna, Austria

The Simmering biomass power plant, owned by the Viennese utility Wien Energie, is exclusively fed with fresh wood from the forest. Producing 23.4 MWe electricity in summer and 15.06 MWe plus 37 MWth for district heating in winter, the plant reduces Vienna’s CO₂ emissions by 144,000 tons per annum. In operation with heat extraction, total efficiency is 83%.

Steam turbine: SST-400, Reheat
Power output: 23.4 MW
Inlet pressure: 120 bar / 1,740 psi
Inlet temperature: 520 °C / 968 °F
Fuel: Fresh wood

SST-300 North Hykeham
Lincoln, UK

“We would definitely recommend Siemens. First because we would work again with them, they have provided a machine that is hard to make and hard to integrate into such a kind of plant, and they have been successful with this project” Tangay Carrabin, Project manager at CNIM

Power output: 25.15 MW
Speed: 5,300 rpm
Live steam pressure: 58 bara
Live steam temperature: 397 °C

Customer: CNIM
Operator: FCC Environment
Reference examples  Concentrated solar plants

ANDASOL 1 + 2, Granada, Spain

The two CSP plants are located in the Granada area, each covering a field of 1.95 km² of which the mirror field size is about 510,000 m². Both Andasol plants have a thermal storage system using molten salt to absorb part of the heat produced in the solar field during the day. This process almost doubles the number of operational hours per year at the solar thermal power plant. Andasol I went online in 2008 and Andasol II in 2009.

Parabolic trough (Oil)
50 MW(e) each

Steam turbine:  2 × Siemens SST-700
Power output:   2 × 50 MW(e)
Inlet steam pressure:  100 bar / 1,450 psi
Inlet steam temperature: 377°C / 711°F

IVANPAH SOLAR POWER COMPLEX, California, USA

BrightSource Energy, a privately owned energy company, developed the Ivanpah Solar Energy Generating System in California’s Mojave Desert. It consists of three separate plants using tower technology and provides approximately 400 MW electricity to the US utilities PG&E and Southern California Edison. The whole complex generates enough electricity to power more than 140,000 homes.

Solar Power Tower (Water/Direct Steam)
3 plants, 392 MW(e) in total

Steam turbine: 3 × Siemens SST-900
Turbine data for the first plant:
Power output:  123 MW(e)
Inlet steam pressure:  160 bar / 2,321 psi
Inlet steam temperature:  540°C / 1,004°F
**PUERTO ERRADO 1 (PE1), Calasparra, Spain**

The PE1 Linear Fresnel demonstration plant, developed by Novatec Biosol AG, commenced selling power to the Spanish grid in March 2009. The 1.4 MW plant, located in Calasparra in the region of Murcia, Spain, has two rows of receivers, each with a length of 860 m, providing direct steam to the steam turbine. Each receiver uses 16 parallel lines of mirrors with a total surface of 18,662 m². A Ruth heat storage system, which utilizes hot water and saturated steam, is used for steam buffering.

**Linear Fresnel (Water/Direct Steam)**
- Power output: 1.4 MW(e)
- Steam turbine: Siemens SST-120
- Inlet steam pressure: 55 bar / 798 psi
- Inlet steam temperature: 270 °C / 518 °F (saturated steam)

**NOOR/Ouarzazate, Morocco**

On February 4, 2016, the King of Morocco, Mohammed VI, dedicated the Noor I unit of Ouarzazate Solar Power Station. This is the first of four phased Noor projects at Ouarzazate site which are expected to provide a total electrical generating capacity of 580 megawatts, making it the largest complex of its kind in the world. Siemens is supplying three turbine-generator sets for the power station.

**Steam turbine: SST-700/900**
- Power output: 160 MW
- Inlet steam pressure: 168 bar(a) / 2,437 psi
- Inlet steam temperature: 380 °C / 716 °F
- Exhaust pressure: 0.06 bar(a) / 0.87 psi
Reference examples  Sugar Mills

Khanh Hoa (Cam Ranh), Sugar Plant, Vietnam

The Khanh Hoa Sugar Plant is located in the Cam Lam District in central coastal Khanh Hoa Province. It handles roughly 3,000 tons of sugarcane per day.

Mitr Phol, Sugar Plant, Thailand

In 1946 Mitr Phol sugar business was initially established in Ratchaburi province as a small family business producing and trading condensed syrup to sugar mills. Meanwhile, it expanded to an internationally engaged enterprise acting in China, Lao, Australia and other countries.

With a transparent management system that is accountable to the public and takes good care of natural environment for more than 55 years, Mitr Phol Group has been honored with a number of prestigious awards both at the national and international levels, e.g. ASEAN Energy Awards 2011.

Grupo Delta Sucroenergia / Brazil

Biggest turbine in the sugar-ethanol sector

The efficiency of the SST-600 steam turbine convinced the customer Grupo Delta Sucroenergia. Siemens installed the biggest steam turbine in the sugar-ethanol sector with a power output of 73.5 MW. It is also the first turbine in Brazil to waive the use of gears with direct drive for the generator.

- Power output: 73.5 MW
- Inlet steam temperature: 520°C
- Inlet steam pressure: 67 bar(a)
- Exhaust: radial downward
- Length: 8.5 m
- Weight: 130 t

Simbhaoli Sugar, Sugar Plant, India

Simbhaoli Sugars is a technology company with a business mix that spans specialty sugars, quality liquor, technology consultancy, co-generated power, extra neutral alcohol (ENA), ethanol and bio-manure. As India’s largest integrated sugar refinery, the Company has pioneered path-breaking innovations in sugar refining (Defeco Remelt Phosphotation and Ion Exchange technology), high value, niche products (specialty sugars) and clean energy (ethanol).

- Technology: SST-300
- Complete: 2013
- Power output: 18 MW
- Speed: 6,800 rpm
- Inlet steam pressure: 86 ata
- Inlet steam temperature: 510°C/950°F
- Exhaust steam pressure: 0.1 ata
Reference examples  Pulp and Paper

Steam Turbines for Pulp & Paper Industry SST-800, Hainan Island / China

Siemens Industrial Technologies was appointed as general contractor for the entire electrical engineering, while Siemens Energy won the order for the Hainan Pulp Mill’s power plant.

- Technology: 2 × SST-800
- Complete: 2004
- Power output: 120 MW (each)
- Inlet steam temperature: 475 °C / 887 °F
- Inlet steam pressure: 80.5 bar / 1,167.5 psi
- Speed: 3,000 rpm
- Extraction steam pressure: 6.5 bar / 94.3 psi
- Exhaust steam pressure: 0.13 bar / 1.88 psi

SST-300 for UPM Caledonian, Scotland / United Kingdom

UPM’s mill is responsible for a third of all industrial and commercial electricity consumed across Ayrshire. With huge amounts of electricity and heat required to drive processes in the pulp and paper industry, UPM was keen to explore ways of reducing its energy costs while improving site competitiveness.

Siemens custom designed its SST-300 steam turbine to meet UPM’s specific requirements at the plant and also provided the control systems. The plant incorporating Siemens technologies has enabled the mill to meet all its steam requirements involved in the production of coated papers – and in particular, drying of the paper.

- Technology: SST-300
- Power output: 27 MW
- Speed: 6,800 rpm
- Inlet steam pressure: 90 bar / 1,305 psi
Steam Turbines for Pulp & Paper Industry SST-800, Klabin/Brazil

Two Siemens SST-800 steam turbines are supplying electricity and process steam to a pulp factory in Brazil. The SST-800 has a capacity of 190 megawatts (MW), making it among the largest steam turbines in use in the pulp and paper industry worldwide.

The plant has a total capacity of 270 MW. The customer is Klabin, a leading manufacturer and exporter of paper and packaging.

- **Power output:** 190 MW
- **Speed:** 3,600 rpm
- **Inlet steam pressure:** 100 bar/1,450 psi
- **Inlet steam temperature:** 498°C/928°F
- **Extraction pressure:** 10 bar/145 psi
- **Exhaust pressure:** 5.4 bar/78.3 psi
Reference examples Dresser Rand

Morning Star Packing, 24 Single Stage Steam Turbines California, USA

Application: Mechanical drive for feed water pumps, boiler fans, hydraulics, generators, slurry pumps, fire systems.
The tomato processing window in the US is May through October. Six months of non-stop production requires rugged, reliable equipment which is the reputation the RLH24 has earned over the years.

Scope of Supply: 24 Single Stage Turbines
Model: RLHB 24
Shipped: 2014

KNPC New Refinery Single Stage, Mechanical Drive steam turbines Kuwait

Kuwait is forging ahead with a new refinery project costing 4 billion Kuwaiti dinars (Dh49.7bn) despite the oil price slump, Kuwaiti officials said.
The construction of Al Zour refinery is part of plans to boost refining capacity to 1.4 million barrels per day (bpd) by 2019 from 940,000 bpd at present

Scope of Supply: 57 SSTs for process and water pump drives
Models: Variety of models to meet power and steam condition
Const. year: 2018 expected completion
Steam Turbine Applied as a Gas Expander Emergency Shut Down Drive
Approximately 85 world wide

Dresser-Rand supplied special expander turbines which operate only when a power outage or other mechanical fault causes tripping of the process compressor and/or the main motor drive. When a “kill cycle” is initiated polyethylene or polypropylene reactor gases are routed from the compressor discharge to the turbine inlet (the turbine exhausts to flare) which starts the turbine and drives the compressor train through an SSS clutch at reduced speed and load for 10 minutes or less. This is adequate time for the process to be poisoned by a “kill gas” which is injected into the reactor vessel thus preventing “solidification” which would require personnel with jackhammers to enter and clean the reactor vessel at a cost of millions in lost production.
